So main advantages of the service from CWS -

1. **CWS collects** upon agreeing to purchase the cables from the customer who is selling the cables.
2. **A good estimate of cooper weight** from cable data sheets and tables controls the expected values to come back. This makes for a good starting point on values to be expected to be paid back.
3. **CWS** can apply **better rates for the cables** and other materials sold, one specialist metals recycler handles all types efficiently, you are involved in the process along the way and can become a regular seller (customer) to CWS.
4. To achieve even higher than my standard rates **good clean sorting** helps. There is ***no need to separate SWA cable's parts***, the steel wire can remain intact. Cut up into 70 - 90cm lengths is best on bigger sizes or just as it comes in coiled up.
4. If ever there is tin plated copper it's best but not essential to keep that seperate the relatively small weight in the mix should not degrade the overall value
5. **De-spooling all cables off drums is required** prior to the next stage in processing, ***if (co.name) staff do this a better rate per kg will be rewarded,*** but it's not compulsory, material can just be collected and measured and value advised afterwards
6. ***CWS can provide fork-liftable hooped 73 x 73cms and 50 x 50cms woven sacks and now 90cms x 40cms x 40cms long length fork-liftable or carryable woven sacks for cut up heavier but smaller amounts of SWA cables ready***, that are taken straight to my processor, ***NOT*** those 1 tonne builders merchant's bags that for cable collection are far too big. Please note for larger amounts of cut-up SWA cables HogBox(es) 100 x 57 x 53 cms are provided which are known as a stackable ALC (attached lid container) with a moulded integral forklift footed base.
7. Upon a meeting and to make more sorting improvements I can **loan out (or you can buy)** my suggested HDPE heavy duty stackable **HogBoxes** either/or **100 x 57 x 53cms** with integral forklift feet (HogBox), or **120 x 100 x 74 cms** one-man HD Grey stackable boxes. - ***see above attachments***.
8. Should you have too many plywood drums around (only plywood), these can be taken along, if there's room, to a company close to where the metal recycling centre is so it's economical for them to be dropped off.
9. My preferred metal processor, one of the biggest in the UK, holds all local and national licenses. The main one you need to know is ISO14001 along with their local City Site License, Carriers Transportation License and Environmental Agency license. This firm has another division offering large corporations a total service of all their metal recycling requirements (many tons per collection), such as a window company still working with aluminium frames etc... engineering fabricators and so on.

I hope this helps to form a good idea of the type of professional service that I can provide with better revenue values reflected in the copper price market no matter whether on the up or down.

I'm based on the Waterwells Business Park, so please don't hesitate to call me in to survey, discuss your ideas for any new requirements to recycle your scrap and unwanted small runs of cables. The CWS operation is clean and tidy involving handling and transport swiftly, no messy materials held in stock, no grindings or filings or dust and debris here, no noise either. ***Please note: A HV Cable cutting, collection and recycling service is now available***

If there were only quite small amounts of cables and lugs etc.. I would purchase together (after agreeing the value) with each other's approval and remit the value by return through a bank transfer upon receipt of your invoice for same. Larger batches would first be processed and after confirmed recovered weights a larger remittance would be released normally within 7-10 days.

VAT REG. NO. GB992 9036 78 [EORI REG'D] Registration number CBDU249135

PROVIDING A PROFESSIONAL RECYCLING SERVICE FOR INDUSTRIAL ELECTRICAL CABLES & COMPONENTS:

Cables - Single Cores & Multicores - commercial & industrial types from super fine conductors (class 5, 6 & above), Cables with steel wire armour or GSWB & TCWB – Special Cables with alternative insulations (PTFE, LSOH) – Very Fine Stranded Cables, all Electronic, Signal & Telecomms wires - Cable Glands & components – All Plated (NFM) Metals, Brass – BusBar and other solid components, Braid and Earth Bonding Materials – Crimping Lugs and Connectors – Mechanical parts made up of special metals and platings, predominately non-ferrous.
